HTML Basics

CkaDinTi sample lesson - non-confidential material for AI quiz testing

1. The role of HTML

HTML stands for HyperText Markup Language. It describes the structure and meaning of a web page. CSS controls the visual presentation, while JavaScript can add interactive behavior.

2. Elements and attributes

Many HTML elements have an opening tag, content, and a closing tag, such as Hello . Attributes give an element extra information and appear in its opening tag. The img element is a void element and has no closing tag.

3. A document structure

The declaration <!DOCTYPE html> tells a browser to use standards mode. The html element contains the head and body. The head holds metadata, such as the document title; the body contains the page content. The title element gives the page a title used in a browser tab.

4. Headings and paragraphs

The h1 element identifies a top-level heading. The h2 element identifies a section heading beneath it. The p element marks a paragraph. Choose headings for their meaning and hierarchy, rather than their visual size.

5. Links and images

The a element creates a link, and its href attribute gives the destination. The img element embeds an image, and its src attribute identifies the image resource. Alternative text in the alt attribute conveys the purpose of an informative image when it cannot be seen. Decorative images normally use an empty alt attribute.

6. Lists

Use ul for an unordered list whose items do not require a numbered sequence. Use ol for an ordered list where the sequence matters. Each item inside either type of list is marked with li.

7. Forms and labels

An input element lets a user enter information in a form. A label can be associated with an input by setting its for attribute to the input id. This association helps users understand the purpose of the input. The type="email" attribute requests an email-address input.

8. Meaningful page regions

Semantic elements describe their purpose. The nav element identifies a navigation section, main identifies the main content, and footer represents a footer for its nearest section or page. Clear structure and meaningful labels help people navigate a page with assistive technology.
